Type of clay : Natural Silicate of aluminium and both, Iron and Magnesium
Major Constituent : Smectite (Montmorillonite) > 75 %
Presentation (dry) : Red Clay Powder
Cation exchange Capacity (C.E.C) : > 59.5 Meq per 100 g.
Loss of Ignition (1000°C) : 15.83 %.
Size : This clay come to powder < 77 µm.

It has to be noted that speaking of a raw mineral chemical analysis is not exactly the same on each part of the quarry without any change of the clay itself.

Clays are mainly characterised by X-ray diffraction and cation exchange capacity.

By this fact we only give an average value for each component.
