Type of clay: Natural Silicate of aluminium and both, Iron and Magnesium

Major Constituent : Smectite (Montmorillonite) 70 to 75 %.

Presentation (dry): Beige light Clay Powder Cation exchange Capacity ( C.E.C ): > 42.6 Meq pour 100 g.

Loss of Ignition (1000°C): 12.41 %.

Size : This clay come to powder  $< 40 \, \mu m$ .

It has to be noted that speaking of a raw mineral chemical analysis is not exactly the same on each part of the quarry without any change of the clay itself.

Clays are mainly characterised by X-ray diffraction and cation exchange capacity.

By this fact we only give an average value for each component.
